

PaySafe Technical Case Study 1

Fauziyyah Anis – PMPM Dibimbing Batch 11

Background

PaySafe, a leading mobile payment app with over 20 million active users across Southeast Asia, is at the forefront of a cashless economy.

**+20 billion
users**

Problem Statement

Cracks have started to appear during peak shopping periods: users are facing delays, failed transactions, and, in some cases, duplicate charges.

Social media is blowing up with complaints, and some users have started switching to competitors. If these issues continue, PaySafe could lose its dominant market position.

Objective

Bring back users' trust in using PaySafe by handling payment delays, failed transactions, and duplicate charges.

Key Results

1. Decreasing the number of complaints related to payment delays, failed transactions, and duplicate charges by 40%
2. Increasing retention rate post feature improvement by 40%

Case Study

1. **What steps** would you take **to identify the root cause** of the problem?
2. Considering that users are frustrated with payment delays and duplicate charges, **propose 3 features or improvements** that would improve the overall user experience during peak periods.
3. How would you measure the success of these improvements? **Identify key metrics (KPIs) to track user satisfaction** and system performance post-implementation.
4. How would you go about **finding out more data before building** the features?
5. Please **draw wireframes (low fidelity; handwriting is perfectly fine)**, and explain the thought process in each screen. Focus on quality over quantity (you don't have to create wireframes for all flows, you can focus on specific feature or workflow out of your listed solutions)

After defining the problem clearly, here are the steps I would take to identify the root causes:

- 1 Understand the condition:** Objective & Business process
- 2 Collect data:** Quantitative & Qualitative
- 3 Analyze data:** Pain Points
- 4 Conduct Root Cause Analysis:** Issue Tree, 5 Whys

While simultaneously improving the scalability, here are the proposed solutions:

Transaction Process Message

Giving transparency of the process
Reduces anxiety about payment status

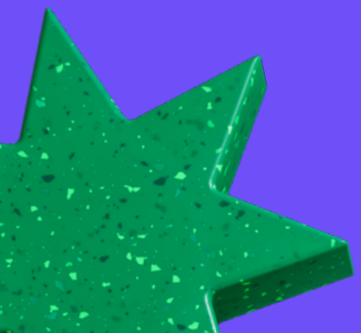

Auto Retry

Managing server traffic
Reduce user retries

Auto Refund

Build users' trust to PaySafe

Problems: Payment delays & Duplicate charges

How it works?

Transaction Process Message

Shows transaction process

Transaction in queue, processing, retrying, failed, successful

Auto Retry

Auto-retrying in the given period

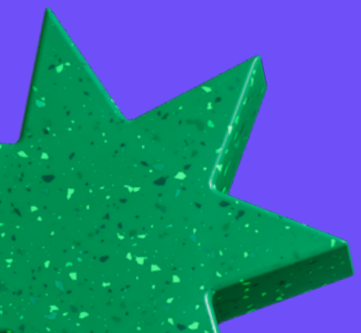

If the auto-retrying is not successful in the given times, users need to retry manually

Auto Refund

The system detects if there is a duplicate charge

Notifying users there would be auto-refund in less than 6 hours

Problems: Payment delays & Duplicate charges

How would I measure the success of these improvements?

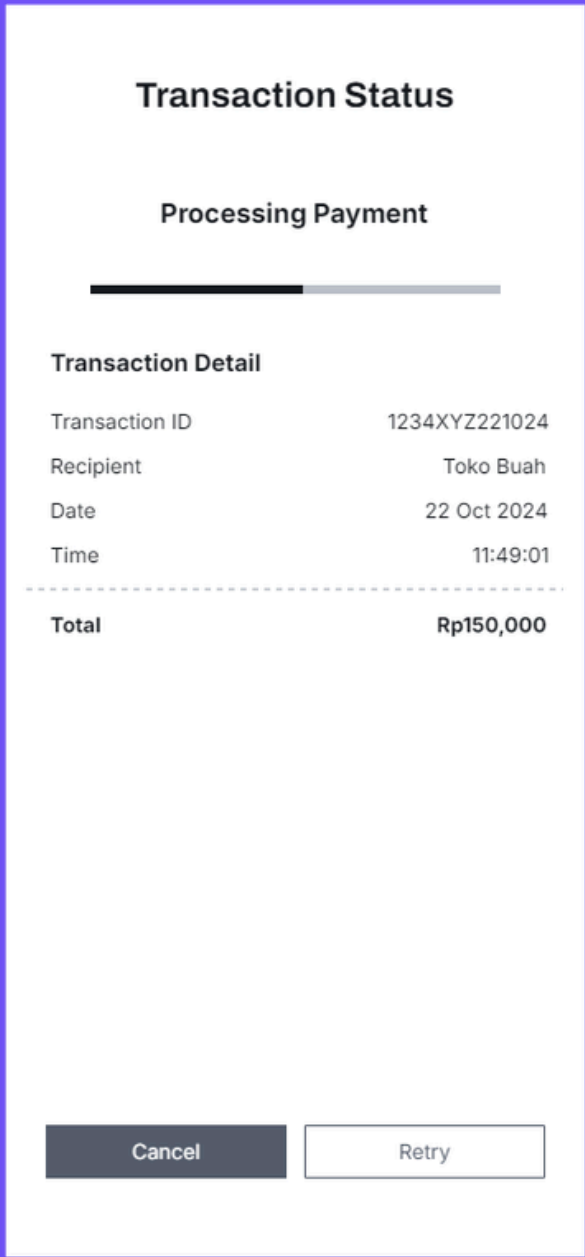

FEATURE	CRITERIA # 1	CRITERIA # 2	CRITERIA # 3
Transaction Process Message	Percentage of users viewing the transaction status page	Number of multiple payment attempts per user	Number of complaints related to payment delays
Auto Retry	Retry success rate	Number of manual retry attempts per user	Retention rate post-failed transaction
Auto Refund	Average time to process auto-refunds	Number of manual refund process	Number of complaints related to duplicate charges

How would I go about finding out more data before building the features?

- 1 Analyze user behavior
- 2 Conduct user research
- 3 Conduct competitor analysis

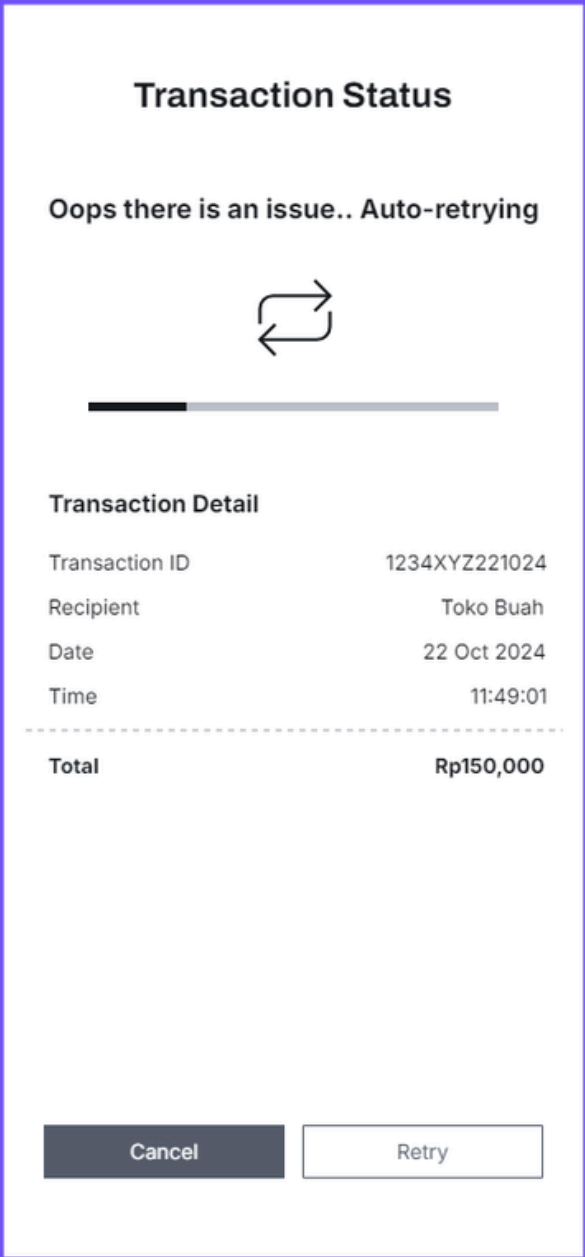

Wireframe

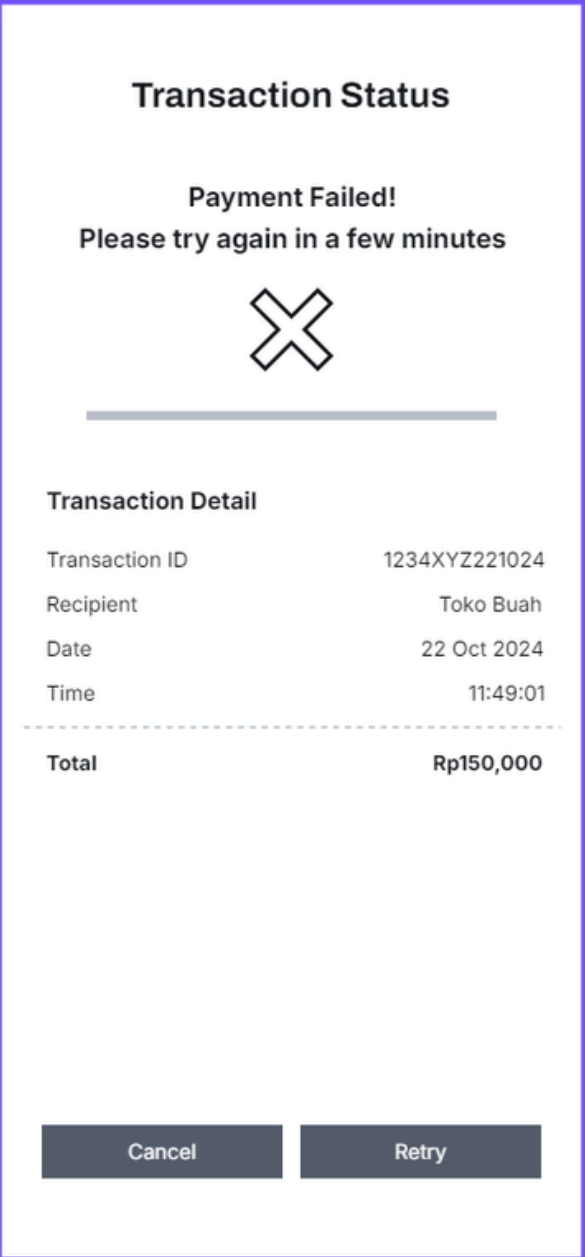

Made with 

The first page to show after users click the payment button. There is a locked retry button.

Made with 

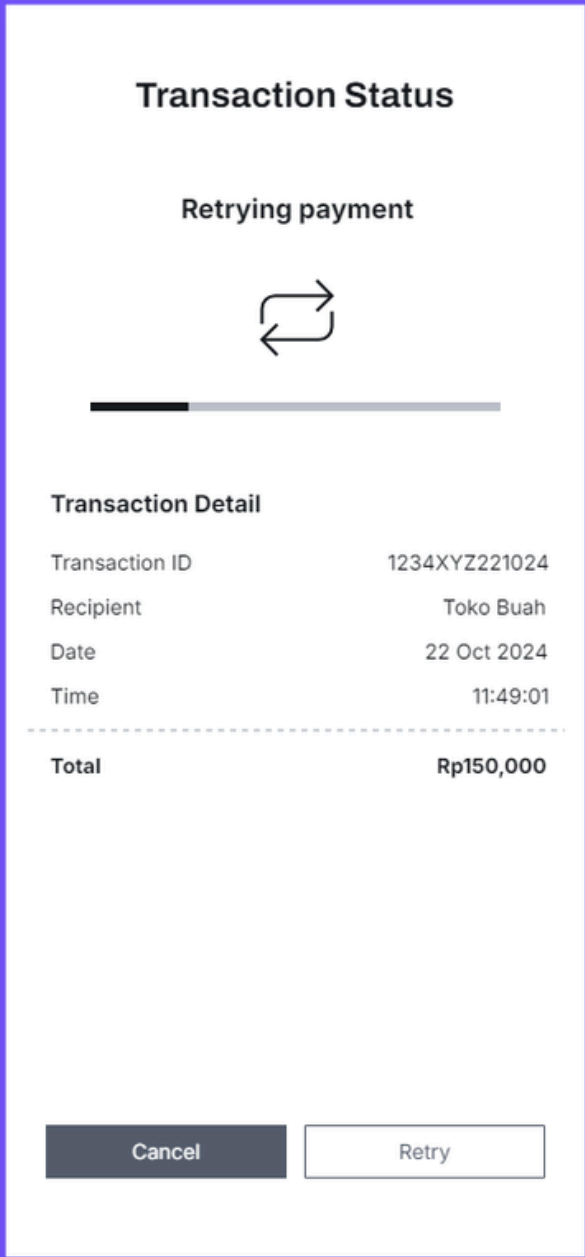

If the payment fails, the system will auto-retry the payment. (Max 3 times)

Made with 

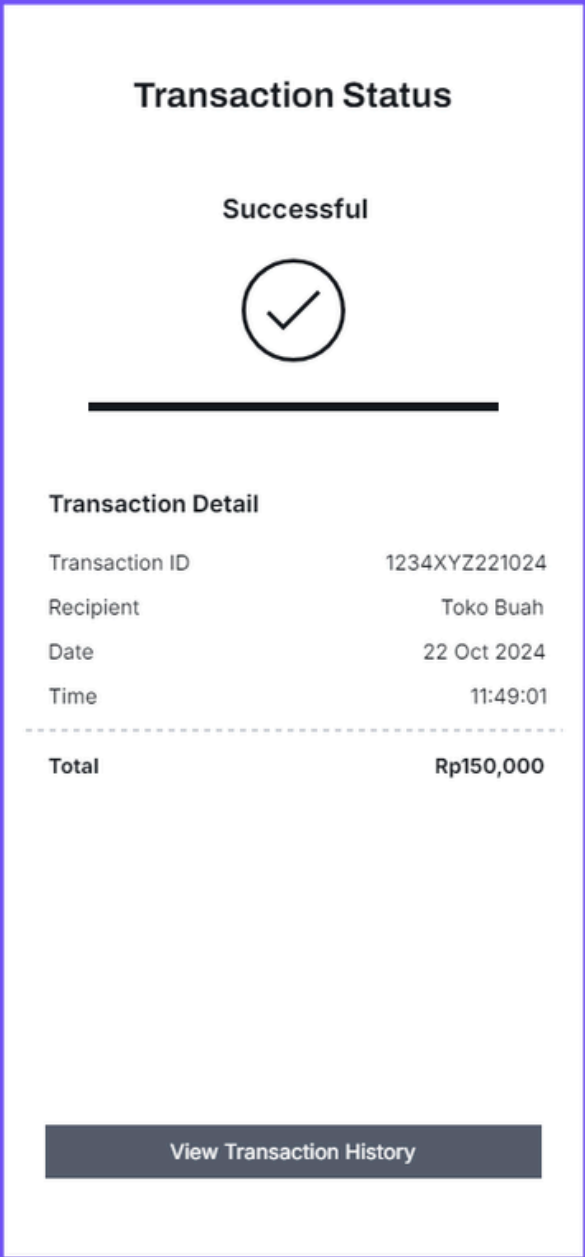

If the payment fails after the third auto-retry, users have to wait and retry manually. Now the retry button is unlocked.

Wireframe

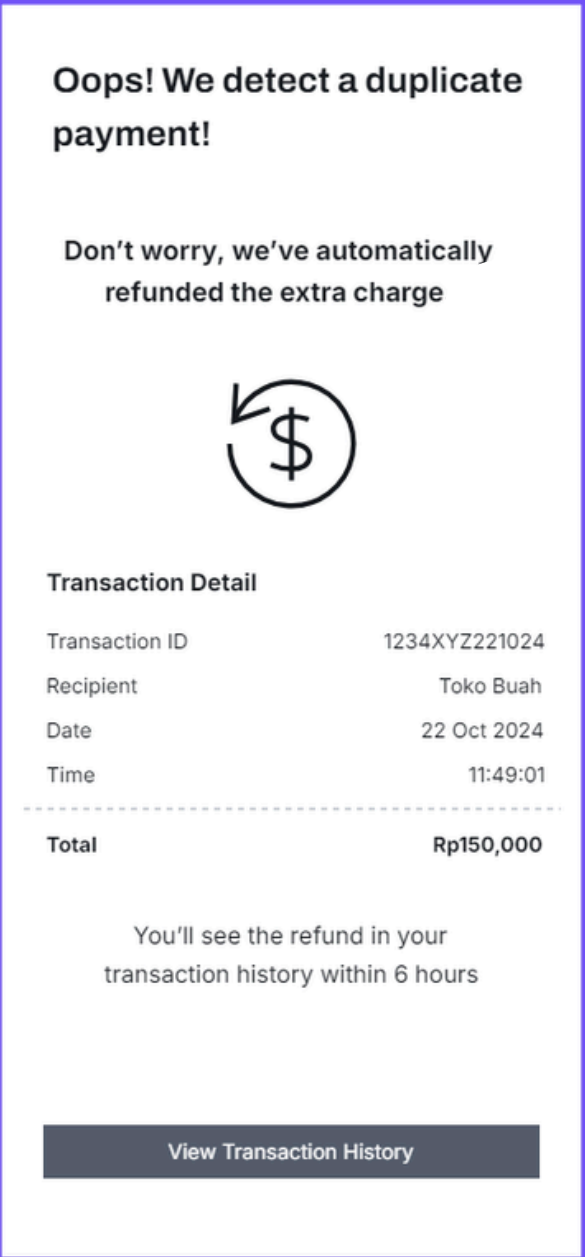

Made with  Visily

This page shows the retrying status from users' manual action. If this fails also, the system loops to the auto-retry process and shows the auto-retrying status.

Made with  Visily

Shows transaction status for successful payment. Users can see transaction history by clicking on the button.

Made with  Visily

This page notifies users if the system detects a duplicate charge and it will auto-refund the extra charge within 6 hours. This page aims to build trust to PaySafe.

Using the MoSCoW framework, I would prioritize:

Must Have

Fixing the Core Infrastructure

Should Have

New feature that supports cross-border payments

Since fixing the core infrastructure is vital for the core operation of the product, I would prioritize this initiative. Building a new feature that supports cross-border payments could have a significant impact, but without the core feature that works properly, this new feature won't work optimally.

How would I coordinate efforts across these teams?

Communicate the urgency, objective, and requirements clearly

Understand their concerns regarding this initiative

Monitoring the progress

Review the implemented solutions

Conclusion

This feature aims to bring back users' trust in using PaySafe by handling payment delays, failed transactions, and duplicate charges.

Proposed Solution

- 1.Transaction Process Message
- 2.Auto Retry
- 3.Auto Refund

Team to Collaborate

1. Engineer: Solve the technical issue
2. QA: Testing these features improvement
3. Customer Support: Solve user-related complaint

Thank
You!
