

Smart Planner App

Technical Case Study 2

Fauziyyah Anis | PMPM Dibimbing Batch 11

Background

- 1 35% of users want a new feature for daily planner
- 2 25% of users want to integrate the planner with an external calendar
- 3 20% of users find difficulty in using the product
- 4 The main competitor offers an AI feature that recommends a schedule based on users' activity
- 5 The team can only develop 1 big feature for the next 3 months

Pattern & Relationship

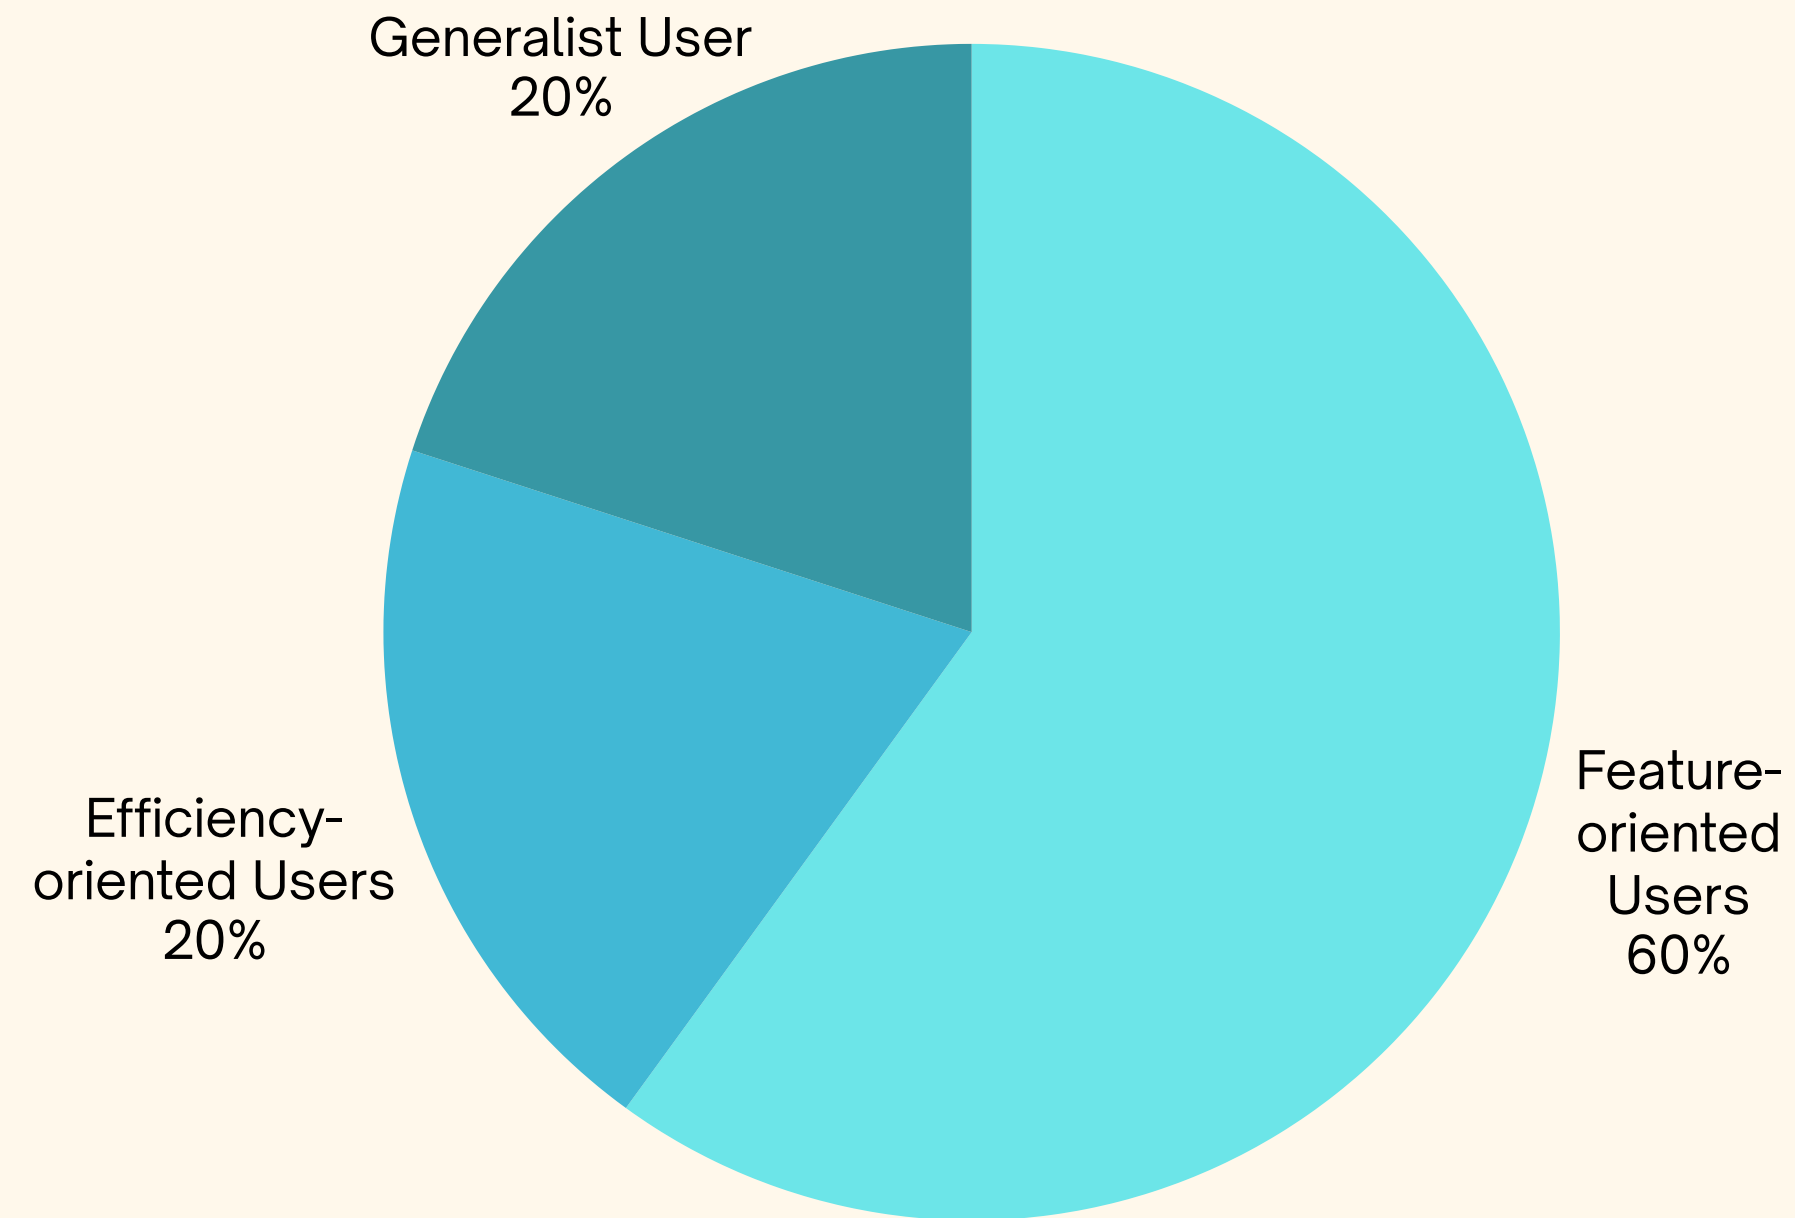

1

Enhance user
experience

2

Developing a new feature might increase
usability challenges

Segmentation

Impact & Trade-Off

Segment	Action	Impact	Trade-Off
Feature-Oriented	Add a new feature.	• Satisfies 60% of users who want a new feature. • Increase functionality & competitiveness of the product	• Might increase usability challenges for 20% of users. • Potential loss of 20% of users due to complexity
Efficiency-Oriented	Change user flow to improve efficiency.	• Prevent 20% of users' churn. • Improving the experience for all users. • Retain current users	• Delays in releasing a totally new feature.

Current Conditions

- 1 The product is a mobile app
- 2 The users are students and professionals
- 3 Features: Reminder, calendar, to-do list, general scheduling
- 4 Every feature has its own page
- 5 Too many buttons and labels on the UI
- 6 Between features are not integrated

Prioritization

Segment	Action	Reach	Impact	Confidence	Effort	RICE Score
Feature-Oriented	Add a new feature.	8	6	6	3	96
Efficiency-Oriented	Change user flow to improve efficiency.	10	10	8	3	266

Problem Statement

Decrease in retention rate for the past 6 months due to product complexity

Hypothesis

If we improve the features to **be more efficient**, then the **retention rate will increase** by 20% because users find it easy to use, **within 6 months**.

Objective

Increase retention by providing seamless user experience

Key Results

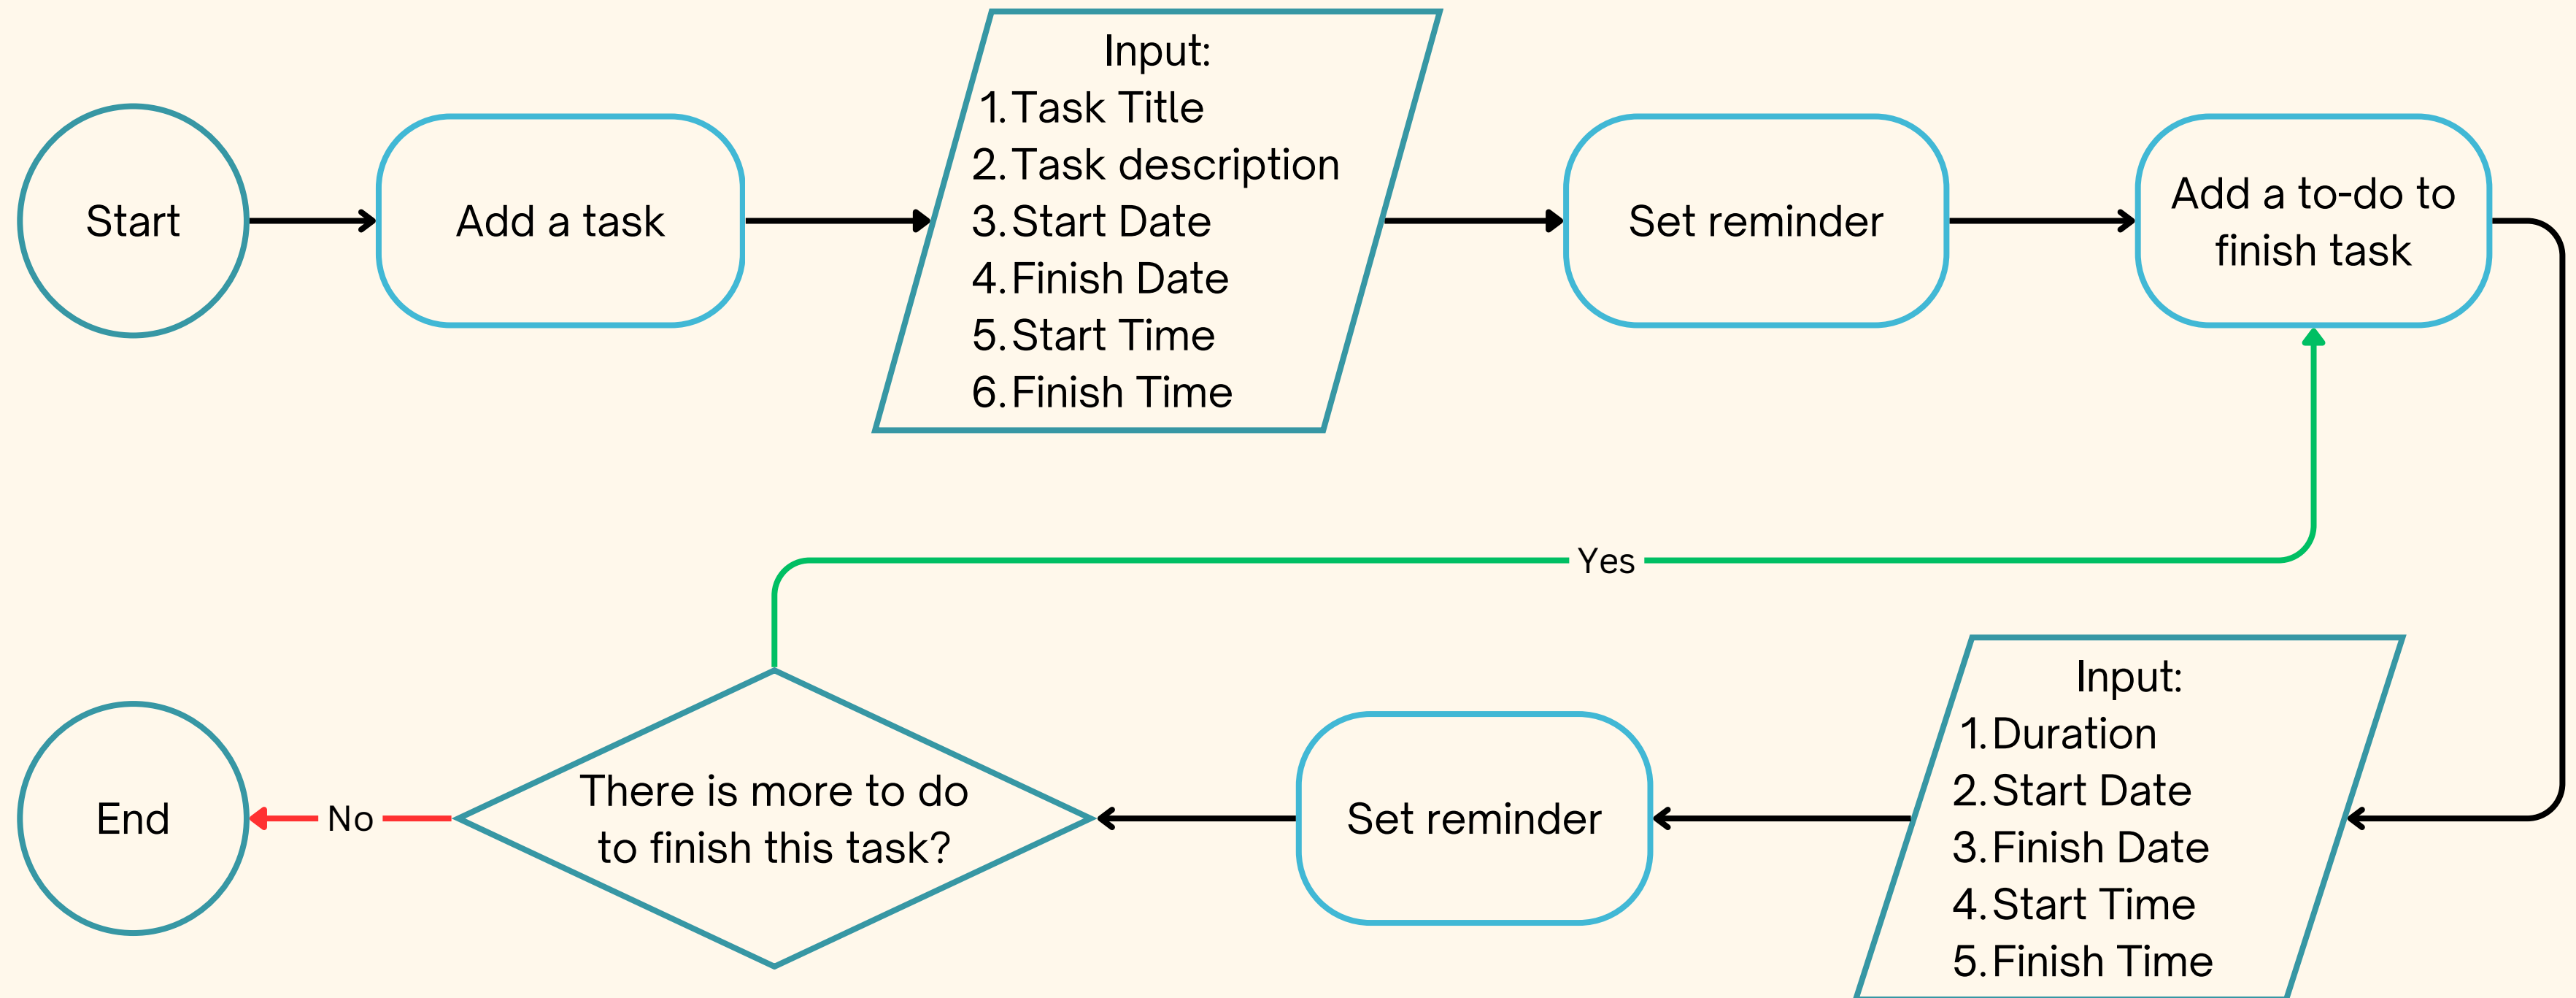

Increase retention rate by 20% within 6 months

Achieve 97% of task completion rate

Existing Flow

Pain Points

1

Users need to input task and its to-do list one-by-one to the calendar

2

Repetitive processes take time and make users bored

3

Allocating the schedule to do some things and aligning with events on the external calendar feels overwhelming

Proposed Solution

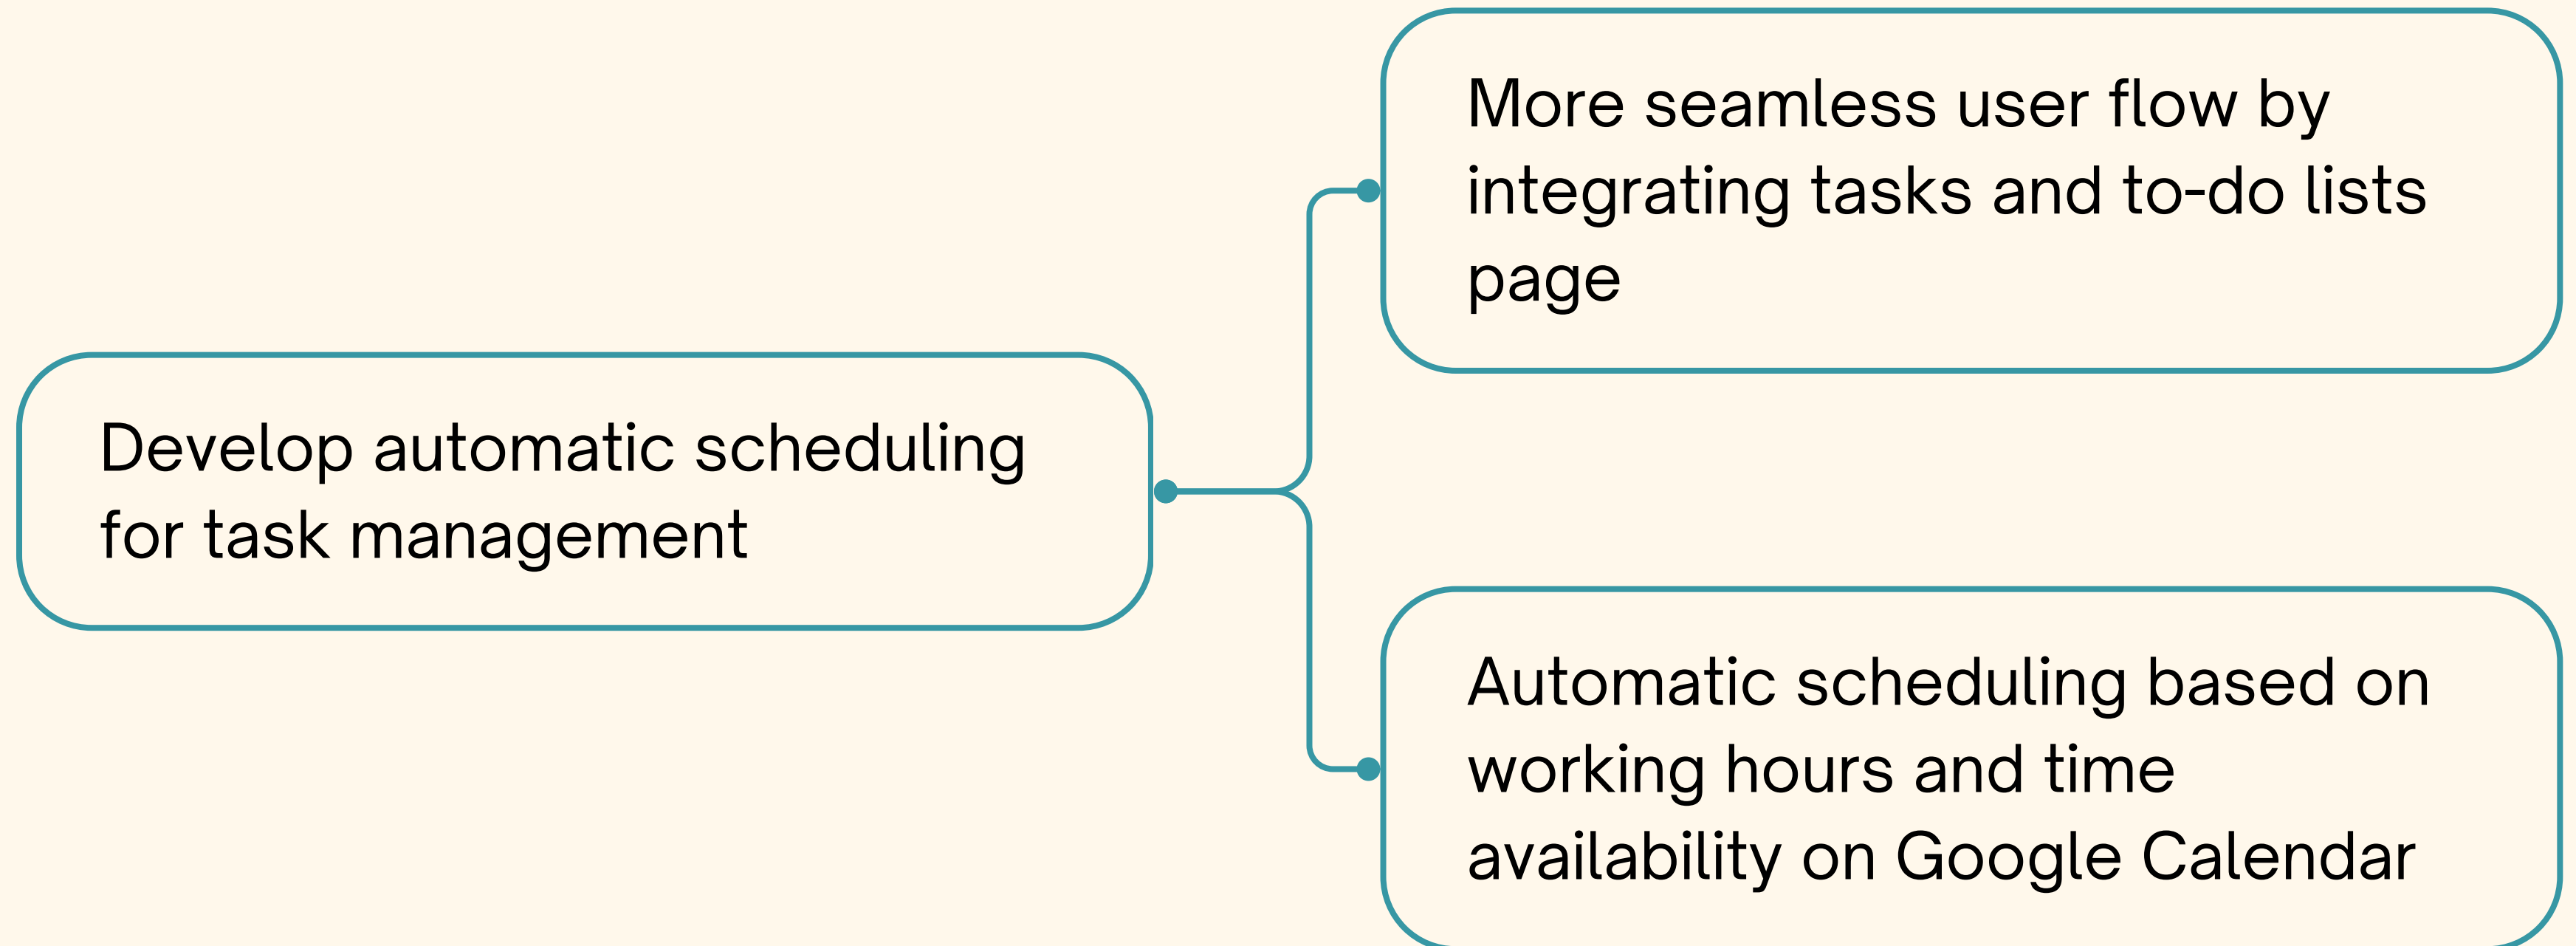

Develop automatic scheduling
for task management

Improve efficiency by
reducing all users' effort

Satisfies all user segments

Stay competitive

Proposed Solution

User Stories & Acceptance Criteria

Title	User Story	Acceptance Criteria
Task and to-do list management page	As a User, I want a seamless flow to manage task and its to-do list, so that I don't have to do a repetitive processes.	(+) Given I have a task, when I go to the task management page, then I want to input the deadline, working hour per day, and its to-do list to finish the task on the same page. (-) Given I am filling out the task management page, when there is a bug and the app is closed, then the system will automatically save the data.
Automatic Scheduling	As a User, I want automatic scheduling for finishing tasks based on my working hours and time availability on Google Calendar, so that I don't have to spend time scheduling manually.	(+) Given I have a task to finish and other agenda noted in Google Calendar, when I finish adding a task and its to-do list, then the system will generate a schedule according to my working hours and time availability. (-) Given I have created the task and the system cannot retrieve the data from Google Calendar, then I will get the error message and be able to edit the generated schedule.

Success Metrics

1

Under 3 minutes completion of adding task and its to-do list

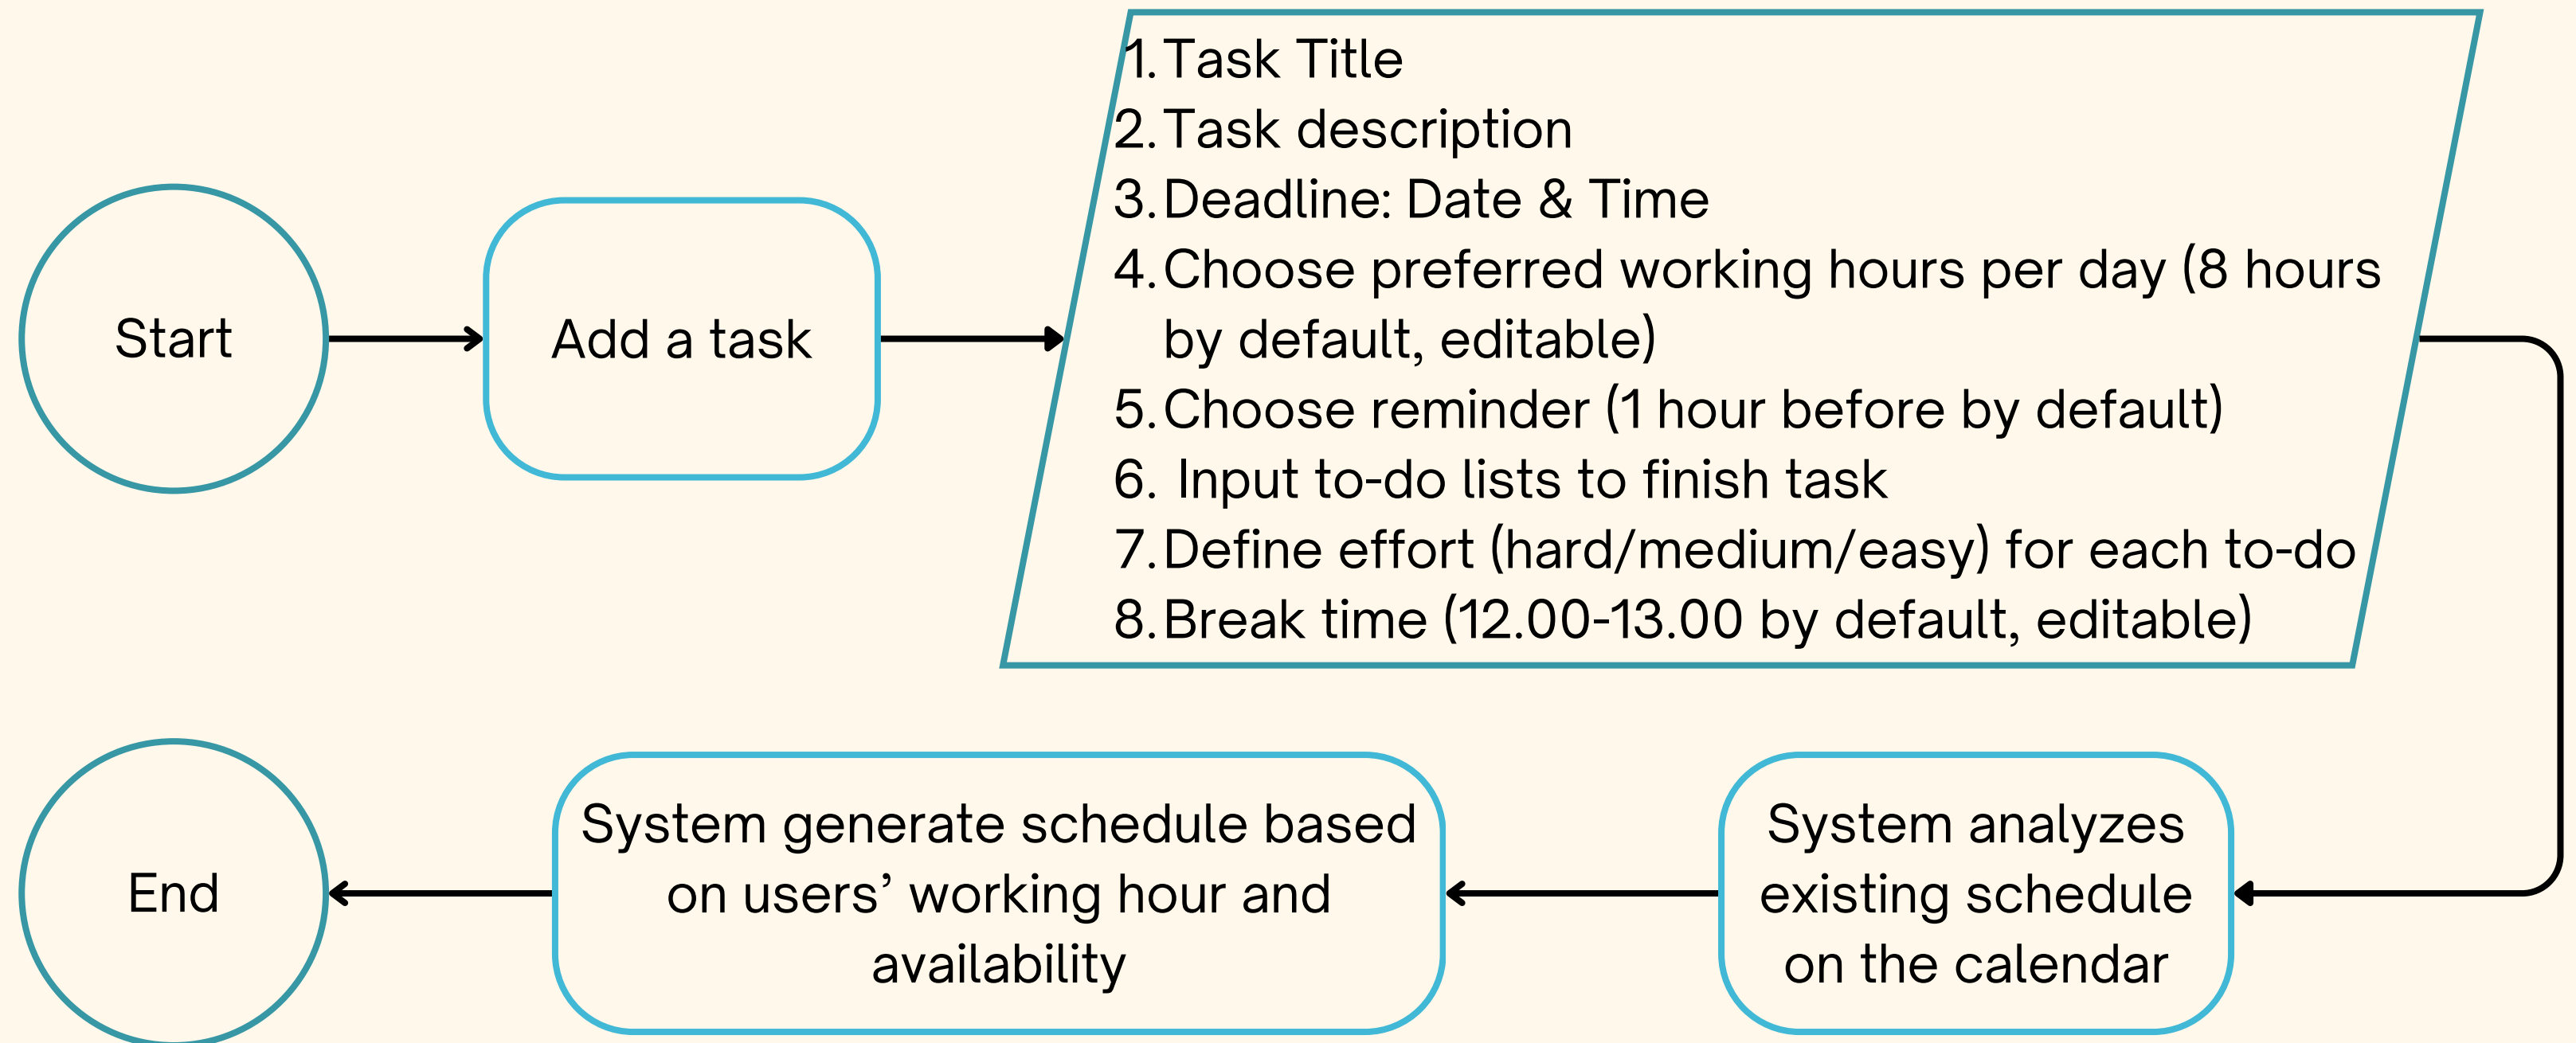

2

Less than 1 minutes to generate schedule

3

Less than 3 edits by users for every generated schedule

New Flow

CONCLUSION

The feature aims to increase the retention rate by 20% by developing automatic scheduling to reduce users' efforts to be more efficient.

THANK YOU
